Why they *leave.*

A model-driven read on the top three forces pulling customers out the door - and the single campaign built to bring them back.

DATASET	MODEL	LIFT@TOP10%
5,630 customers	Random Forest	5.96×

THE THREE DRIVERS

Three signals explain *who* walks away.

Ranked by Random Forest feature importance, together, these three variables carry over 43% of the model's predictive weight.

01

Short tenure

41.8%

churn rate in the first 3 months vs 0% beyond 2 years.

Newly acquired customers are by far the riskiest segment. The first 90 days are the most fragile window of the lifecycle and absorb most of the churn.

26% of model importance

02

Low Cashback

−15%

correlation with churn : the less they earn, the faster they leave.

Customers receiving lower cashback churn more. Loyalty mechanics are working; they just need to be extended to the disengaged tail.

10% of model importance

03

Recent complaint

3×

churn probability after a single complaint in the last month.

One unresolved complaint nearly triples the odds of leaving. Service recovery is the single highest-leverage intervention available.

7.5% of model importance

THE RECOMMENDATION

A *tiered retention playbook*, one driver at a time.

Score every customer monthly, target the top decile, and deploy the play that matches their dominant risk signal.

FOR NEW CUSTOMERS

The First 90 Days

Trigger an onboarding journey for every customer with Tenure < 3 months: welcome series, dedicated CS callback on order #2, and a free-shipping voucher tied to a second purchase within 30 days.

FOR DISENGAGED

Cashback Boost

For top-decile customers with low CashbackAmount, run a 60-day tiered cashback upgrade combined with personalised category recommendations based on PreferedOrderCat.

FOR COMPLAINERS

Service Recovery

Every customer who filed a complaint in the last month enters a priority queue: personal CS callback within 24 hours and a make-it-right coupon scaled to order value.
